Team Name :ZenTeam

Team Leader Name : Priyanka Singh

Problem Statement :The internet shapes our emotions daily, yet we have zero visibility into its mental cost.

Brief about the Idea:

We live in a virtual world where constant engagement with digital world leads to phenomenon like Doom scrolling, Infinite data loop which leads to problem of emotional imbalance, anxiety, fear, data addiction , negativity bias etc.

Mindful Browse analyses browsing **patterns and signals** (such as time spent, repetition, and content categories) to generate simple, explainable wellbeing insights. It helps users recognize:
Emotional overload
Doomscrolling behaviour.
Lack of cognitive diversity.
Gaps between intentional and unconscious browsing
All insights are presented in a **non-judgmental, non-diagnostic** manner

Your solution should be able to explain the following:

How different is it from any of the other existing ideas?

1. We don't track user data but try to give insight
2. Not productivity, Not therapy but Awareness
3. Privacy- first wellbeing app for internet age.

- How will it be able to solve the problem?

1. Captures user consented meta data and brings insights on emotional well being by a metric.

2. Draw insights on data using AI driven sentiment analysis. Help user understand why they feel a certain way by daily and weekly insights.

- USP of the proposed solution

The first app which brings out emotional and cognitive insights on data consumption pattern. Mindful Browse does not limit access or enforce rules. It empowers users through **awareness, context, and reflection**, making digital wellbeing a conscious choice rather than a forced constraint.

List of features offered by the solution

- Browsing Pattern Awareness
- Emotional Load Insights
- Doomscroll Detection -
- Cognitive Diversity Analysis -
- Mindfulness Gap Tracking
- Daily & Weekly Wellbeing Reports-

List of features offered by the solution

Privacy by Design

Mindful Browse is built with strict data minimization:

- Processing happens primarily on-device
- No storage of browsing history or page content
- Only aggregated, anonymized metrics are stored (opt-in)
- No ads, no tracking, no data resale
- Users retain full control over their data at all times.

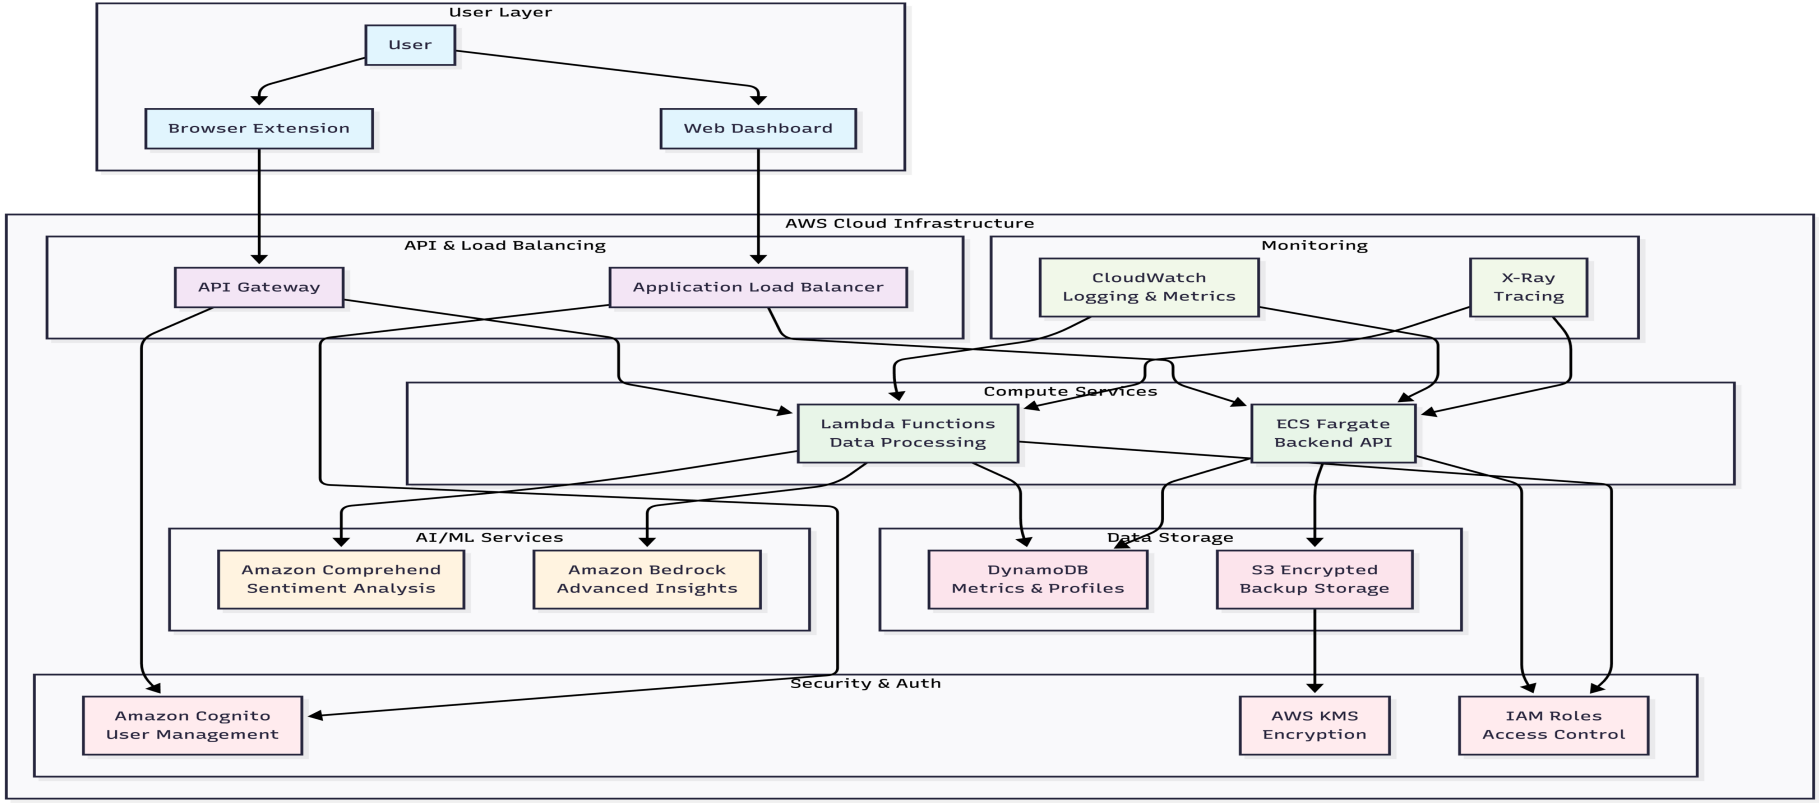
Architecture diagram of the proposed solution:



Technologies to be used in the solution:

1. Security & Idenitity - AWS Cognitio – for Authentication, KMS,IAM ,
2. Compute Layer- ECS Fargate for backend API and AWS Lambda – for running sentiment analysis, classification etc
3. Storage Services - S3- for storing user isnsights like weekly insights report and Dynamo DB
4. AI/ML- Amazaon Bedrock- for AI tools and Amazon Comprehend – for sentiment analysis on user metadata summary.

Estimated implementation cost (optional):

Assumptions (important)

- ❑ Chrome extension first
- ❑ On-device scoring (privacy-first)
- ❑ AWS backend for sync + insights
- ❑ Small founding team (India-based)
- ❑ No heavy AI/LLM in v1
- ❑ MVP-quality UI (not Pixel-perfect)

This will take approx. 10 Lakhs with India based developer.

With 5 to 6 lakhs – we can cut corners but product can go live.
